

## Who is responsible for setting nutrition requirements in the UK?

- In the UK we have a set of Dietary Reference Values (DRVs).
- DRVs are a series of estimates of the energy and nutritional requirements of different groups of healthy people in the UK population. They are not recommendations or goals for individuals.
- These were set by the Committee on Medical Aspects of Food and Nutrition Policy (COMA) in 1991.
- COMA used four types of Dietary Reference Values:

### **Estimated Average Requirements (EARs)**

The **EAR** is an estimate of the average requirement of energy or a nutrient needed by a group of people (i.e. approximately 50% of people will require less, and 50% will require more).

### **Reference Nutrient Intakes (RNIs)**

The **RNI** is the amount of a nutrient that is enough to ensure that the needs of nearly all a group (97.5%) are being met.

### **Lower Reference Nutrient Intakes (LRNIs)**

The **LRNI** is the amount of a nutrient that is enough for only a small number of people in a group who have low requirements (2.5%) i.e. the majority need more.

### **Safe Intake**

The **Safe intake** is used where there is insufficient evidence to set an EAR, RNI or LRNI. The safe intake is the amount judged to be enough for almost everyone, but below a level that could have undesirable effects.

- For most vitamins and minerals, DRVs are given as Reference Nutrient Intakes (RNI). Most vitamins and minerals also have Lower Reference Nutrient Intakes.
- COMA has since been disbanded and replaced by the Scientific Advisory Committee on Nutrition (SACN) that advises the government on diet and health.
- SACN revised the population recommendations for estimated energy requirements in 2011 and in its report *Carbohydrates and Health 2015* made new recommendations for free sugars and fibre.
- SACN made new recommendations for vitamin D in its report *Vitamin D and Health 2016*.
- The DRVs are reflected in the UK's food based guidelines, the Eatwell Guide, a visual illustration of the types and proportions of foods that contribute to a healthy and well-balanced diet.

# Nutrition Requirements

## Macronutrients - Energy, fat, carbohydrates and protein

### *Estimated Average Requirements for Energy* *Infants*

<i>Age</i>	<i>Males</i>		<i>Females</i>	
	<i>MJ</i>	<i>kcal</i>	<i>MJ</i>	<i>kcal</i>
<b>Breastfed</b>				
<b>1-2 months</b>	2.2	526	2.0	478
<b>3-4 months</b>	2.4	574	2.2	526
<b>5-6 months</b>	2.5	598	2.3	550
<b>7-12 months</b>	2.9	694	2.7	646

<i>Age</i>	<i>Males</i>		<i>Females</i>

<b>3 years</b>	4.9	1171	4.5	1076

# Nutrition Requirements

## Estimated Average Requirements for children

Age (years)	Males		Females	
	MJ/d	kcal	MJ/d	kcal
4	5.8	1386	5.4	1291
5	6.2	1482	5.7	1362
6	6.6	1577	6.2	1482
7	6.9	1649	6.4	1530
8	7.3	1745	6.8	1625
9	7.7	1840	7.2	1721
10	8.5	2032	8.1	1936
11	8.9	2127	8.5	2032
12	9.4	2247	8.8	2103
13	10.1	2414	9.3	2223
14	11.0	2629	9.8	2342
15	11.8	2820	10.0	2390
16	12.4	2964	10.1	2414
17	12.9	3083	10.3	2462
18	13.2	3155	10.3	2462

## Estimated Average Requirements for adults

Age (years)	Males		Females	
	MJ/d	kcal	MJ/d	kcal
19-24	11.6	2772	9.1	2175
25-34	11.5	2749	9.1	2175
35-44	11.0	2629	8.8	2103
45-54	10.8	2581	8.8	2103
55-64	10.8	2581	8.7	2079
65-74	9.8	2342	8.0	1912
75+	9.6	2294	7.7	1840

UK Energy requirements are based on the average energy required for people of a healthy weight who are moderately active

- We can measure energy in calories (kcal) or in joules (MJ).
- Estimated energy requirements will be greater in more active people, and lower in those that are more sedentary. These will differ depending on size and gender.
- Energy requirements for pregnant women increase by 0.8 MJ/day or 200 kcal/day, but only in the final three months of pregnancy.

## Carbohydrate and Fat

- DRVs have been set for fat and carbohydrates (including sugars and dietary fibre) for the population.
- DRVs for total fat, saturated fat, total carbohydrates and sugars are given as a percentage of daily energy intake.

DRVs for carbohydrate and fat as a percentage of energy intake	
	% Daily Food Energy
Total Carbohydrate*	50%
<i>of which</i> free sugars*	Not more than 5%
Total Fat†	Not more than 35%
<i>of which</i> Saturated Fat†	Not more than 11%

\*based on SACN 2015 recommendations for population aged 2 years and above

†based on COMA 1991 recommendations for population aged 5 years and above

- **Total carbohydrate** includes all starch, sugars and dietary fibre.
- **Free sugars** are sugars added to foods and drinks by the manufacturer, cook or consumer, plus sugars naturally present in honey, syrups and fruit juice.
- **Total fat** includes all saturated and unsaturated fat (mono- and polyunsaturated).
- **Saturated fat** - Several studies have shown a high saturated fat intake to be linked with high blood cholesterol. Elevated blood cholesterol is a risk factor for coronary heart disease. Studies have shown that replacing saturated fat with unsaturated fat in the diet reduces blood cholesterol and lowers the risk of heart disease and stroke.
- On average in the UK we currently eat too much saturated fat and added sugar, but not enough fibre.
- **Dietary Fibre** – new recommendations were made by SACN in 2015 for the population aged 2 years and over:

Age group	Recommended intake per day (g)
2-5 years	15
5-11 years	20
11-16 years	25
17 years and over	30

## Salt

Age group	Maximum salt intake per day (g)
0-6 months	<1
6-12 months	1
1-3 years	2
4-6 years	3
7-10 years	5
11 years and above	6

The target salt intakes set for adults and children do not represent ideal or optimum consumption levels, but achievable population goals.

# Nutrition Requirements

## Protein

### Reference Nutrient Intake for children

Age group	RNI per day (g)
0-3 months	12.5
4-6 months	12.7
7-9 months	13.7
10-12 months	14.9
1-3 years	14.5
4-6 years	19.7
7-10 years	28.3

## Adults

- The Reference Nutrient Intake (RNI) is set at 0.75 g of protein per kilogram bodyweight per day in adults.

### For example:

- if an adult weighs 60 kg, they will need:

$$60 \times 0.75 \text{ g/d} = 45 \text{ g protein a day}$$

- if an adult weighs 74 kg, they will need:

$$74 \times 0.75 \text{ g/d} = 55.5 \text{ g protein a day}$$

- Protein requirements increase in pregnancy (an additional 6 g/d) and lactation (an additional 11 g/d 0-6 months and 8 g/d 6+ months)

Pregnancy	+ 0.1 <sup>†</sup>	+ 0.3	**	**	**	+ 100 <sup>§</sup>	+ 10 <sup>†</sup>	+ 100 <sup>¶</sup>	10
Lactation:									
0-4 months	+ 0.2	+ 0.5	+ 2	**	+ 0.5	+ 60	+ 30	+ 350	10
4+ months	+ 0.2	+ 0.5	+ 2	**	+ 0.5	+ 60	+ 30	+ 350	10

\*Based on protein providing 14.7% of EAR for energy \*\*No increase †For last trimester only ‡Safe intake. For more information on vitamin D recommendations, [visit our website](#) §Current government advice is for all women who could become pregnant to take a daily supplement of 400µg of folic acid before they're pregnant and during the first 12 weeks of pregnancy. This is to reduce the risk of neural tube defects (NTDs) such as spina bifida. ¶Having large amounts of vitamin A can harm an unborn baby. If you're pregnant or thinking about having a baby, don't eat liver or liver products (e.g. pâté) because these are very high in vitamin A, and avoid taking supplements that contain vitamin A. For more information on nutrition in pregnancy see <http://bit.ly/2Z1jQS9>

mg/d – milligram per day. A milligram is one thousandth of a gram

µg/d – microgram per day. A microgram is a millionth of a gram

\*No increase <sup>1</sup>Phosphorous RNI is set equal to calcium in molar terms; <sup>2</sup>1mmol sodium = 23 mg; <sup>3</sup>1 mmol potassium = 39 mg; <sup>4</sup>Corresponds to sodium 1 mmol = 35.5 mg; <sup>5</sup>Insufficient for women with high menstrual losses where the most practical way of meeting iron requirements is to take iron supplements

Sources: Department of Health, Dietary Reference Values for Food Energy and Nutrients for the United Kingdom, HMSO, 1991. SACN Vitamin D and Health, 2016.

## Factors affecting requirements

- **Age**  
*e.g.* the RNI for vitamin C for a child aged 1 year and under is 25 mg/d, and for an adult is 40 mg/d
- **Gender**  
*e.g.* the RNI for iron in women aged 19-50 years is 14.8 mg/d, which is higher than for men (8.7 mg/d) to cover menstrual losses
- **Growth**  
*e.g.* adolescents have higher calcium requirements to cover their bone growth
- **Pregnancy and Lactation**  
*e.g.* The RNI for calcium in women that are breastfeeding is 550 mg/d more than adult females who are not breastfeeding.

## Reference Intakes (RIs) for labelling

### *Helping the consumer make better choices for a healthier diet*

- Reference Intakes (RIs) are used on nutrition labels on packaged food.
- Reference intakes are set by European law, as a guide for the amount of energy and key nutrients that can be eaten on a daily basis in order to maintain a healthy diet.
- The values are maximum amounts based on an average female adult. They are not individual recommendations and your needs may well be different to the RI, depending on your age, gender and how physically active you are.
- There are currently no RIs that can be used specifically for children.
- Food labels show the percentage of the RIs that is provided per 100 g/100 ml and/or per portion of the food item.

Energy or Nutrient	Reference Intake
Energy	8400 kJ/2000 kcal
Fat	70 g
Saturates	20 g
Carbohydrate	260 g
Total sugars	90 g
Protein	50 g
Salt	6 g
